2.2 Variation Factors

The Federal Public Debt - FPD registered a 0.64% nominal increase, moving from R\$ 2,067.28 billion in February to a level of R\$ 2,080.61 billion in March. This variation was generated by net redemptions in the amount of R\$ 3.30 billion and to positive appropriation of interest in the amount of R\$ 16.63 billion.

3.3 Average Life

Since January 2014, the National Treasury releases the data of average life using new methodology called Average Term to Maturity - ATM, which is most commonly found in the international literature and therefore allows greater comparability between Brazil and other countries as refers to the maturity of government debt.

The new methodology for the average life is calculated by averaging weighted remaining time to maturity of each security that make up the FPD, considering principal only. The weighting occurs by value of each security, using their face value.

FPD average life, in this new methodology, shifted from 6.49 years in February to 6.56 years in March.

¹ The new methodology for the average life is calculated by averaging weighted remaining time to maturity of each security that make up the FPD. For securities and contractual debt that have intermediate amortizations, such amortizations are also part of the calculation of average life.

² FPD average life values by the old methodology for Dec/12 and Dec/13 are, respectively, 6.81 and 6.72 years.

4. Federal Public Debt - FPD Average Cost

4.1 Outstanding Average Cost

FPD cumulative 12-month average cost decreased 0.11 percentage points, moving from 11.57% per year in February to 11.46% per year in March.

At the same time, DFPD cumulative 12-month average cost shifted from 10.87% per year in February to 11.03% per year in March, mostly as a consequence of greater growth of indexes tied to the bonds. One should highlight the significant growth of IPCA in the period.

With respect to EFPD, this indicator registered a decrease from 25.89% per year in February to 20.75% per year in March, mostly as a result of 3.02% devaluation of the American Dollar against the Brazilian Real in March 2014, compared to 1.94% valuation in March 2013.

¹ Average, in the month, of the daily financial volume of definitive transactions. There are not considered: i) transactions in which pricings are not in +/- 25% range of the price accepted on purchase and sale transactions (outliers); ii) transactions in which the National Treasury or the Central Bank is the financial principal;

² Share of securities volume traded compared to total volume traded in the month;

³ Variation of total traded in the month compared to the previous month;

Obs.1: Date calculated based on the original numbers, before roundings;

Obs.2: On brokerage operations, only the values of the final principals are accounted.

LTN maturing in April 2014 continued as the fixed-rate security with the largest financial volume. Second place was occupied again by LTN maturing in January 2016. Third place was occupied by LTN maturing in January 2015, which had not even appeared among the top five securities in the previous month.

As regards NTN-F, maturities in January 2021 secured first place, preserving the previous month's position. Second place was occupied again by those maturing in January 2017. Third place was occupied again by those maturing in January 2023.

Among LFT, securities maturing in March 2020 secured first place, with a gain of one position. Second place was occupied by those maturing in March 2015, with a gain of one position. Third place was occupied by those maturing in September 2014, with a gain of one position.

Finally, NTN-B maturing in August 2016 secured first place, with a gain of one position. Second place was occupied by those maturing in August 2014, which had not even appeared among the top five securities in the previous month. Third place was occupied by those maturing in May 2015, with a loss of two positions.

5.2 Public Securities Yield

The Anbima Market index - IMA³, created by ANBIMA⁴ in a partnership with the National Treasury, verifies the profitability of a theoretical portfolio composed of public securities in circulation on the market. It is considered an efficient parameter for purposes of evaluating the evolution of public security profitability, and has introduced greater dynamics into the primary and secondary federal public debt markets.

Data for the month of March indicate a slight increase of 0.17 percentage points in the IMA-S index, referring to SELIC-linked securities, and increase of 1.27 percentage points in the General Index. At the same time, increase of 0.51 percentage points was registered in the yield of fixed-rate securities, represented by the IRF-M. There was also increase of 1.32 percentage points in IGP-M-linked securities, represented by the IMA-C. There was increase as well of 2.42 percentage points under IPCA-linked securities, represented by the IMA-B.

³ IMA - Fixed-rate indexes calculated on the basis of the evolution of the market value of portfolios composed of public securities. The overall IMA is the result of weighting of the variations of each index; the IRF-M is composed of fixed-rate securities (LTN and NTN-F); the IMA-C, of securities tied to the IGP-M (NTN-C); the IMA-B, composed of securities tied to the IPCA (NTN-B); and the IMA-S, of securities tied to the SELIC rate (LFT).
